

## **Man and Machine, teaming or fighting?**

Mr. Isaac Mao

Director, Social Brain Foundation; Co-Founder, Berry Labs

We are living in an age of turbulence, also in different type of conflicts, and tons of new innovations shaping our behaviors. Within 15 years, we would see some big shifts in our society that machines will take over many jobs from humans, driver-less cars will be more popular on road, drones will be killing more lives, more information and virtual reality will be presented by machines instead of humans, and of course machines will produce every type of troubles than ever before. Who should be responsible if machine caused havoc? Who should make final decisions in these scenarios? How to prevent from losing control? Are there any models that man and machine can team up? Should we design some broad principles, or just let it naturally happen? We need to find answers to all of these questions, before it's becoming a doom.
